

Amendments to the Abstract:

Please replace the Abstract with the following amended abstract:

~~A method is provided for determining the location and/or the positioning~~ The position of an object, in particular a vehicle such as a train, moving along a known course, including the following steps: ~~determining an absolute position of the object with a first confidence interval;~~ determining is determined by a relative measured position of the object with a while its associated second confidence interval is smaller than a first confidence interval associated with an absolute measured position and is determined by the absolute position when the second confidence interval exceeds the first confidence interval., ~~selecting the smaller confidence interval among the first and the second confidence interval, and determining said the location and/or positioning of the object by means of the position corresponding to said the smaller confidence interval.~~
